ERSP Fall PI Meeting

Oak Ridge, TN

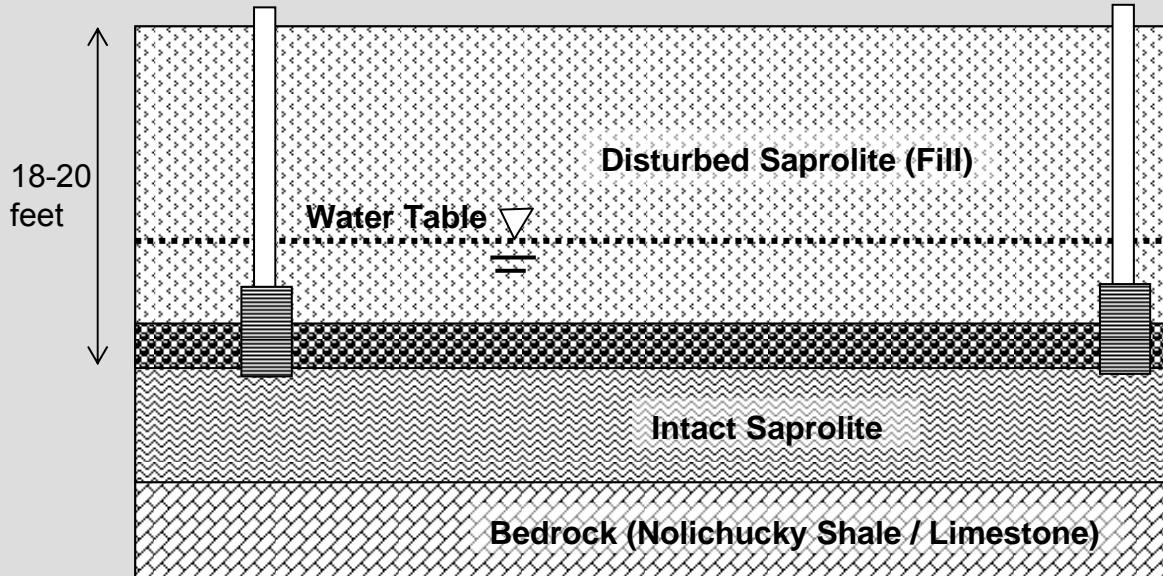

23-25 October 2006

NAPD/FRC

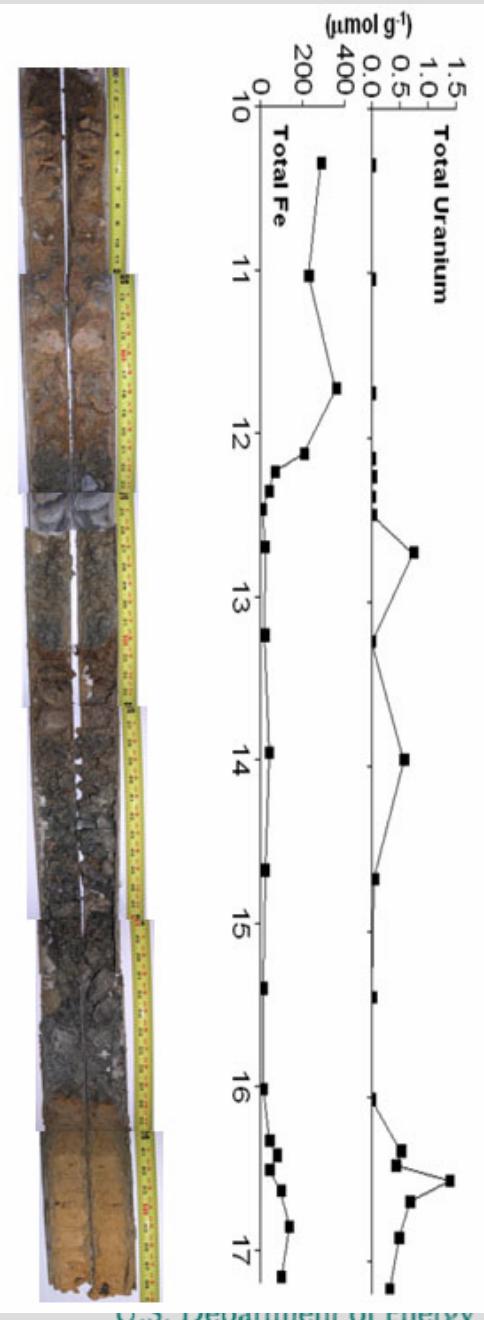

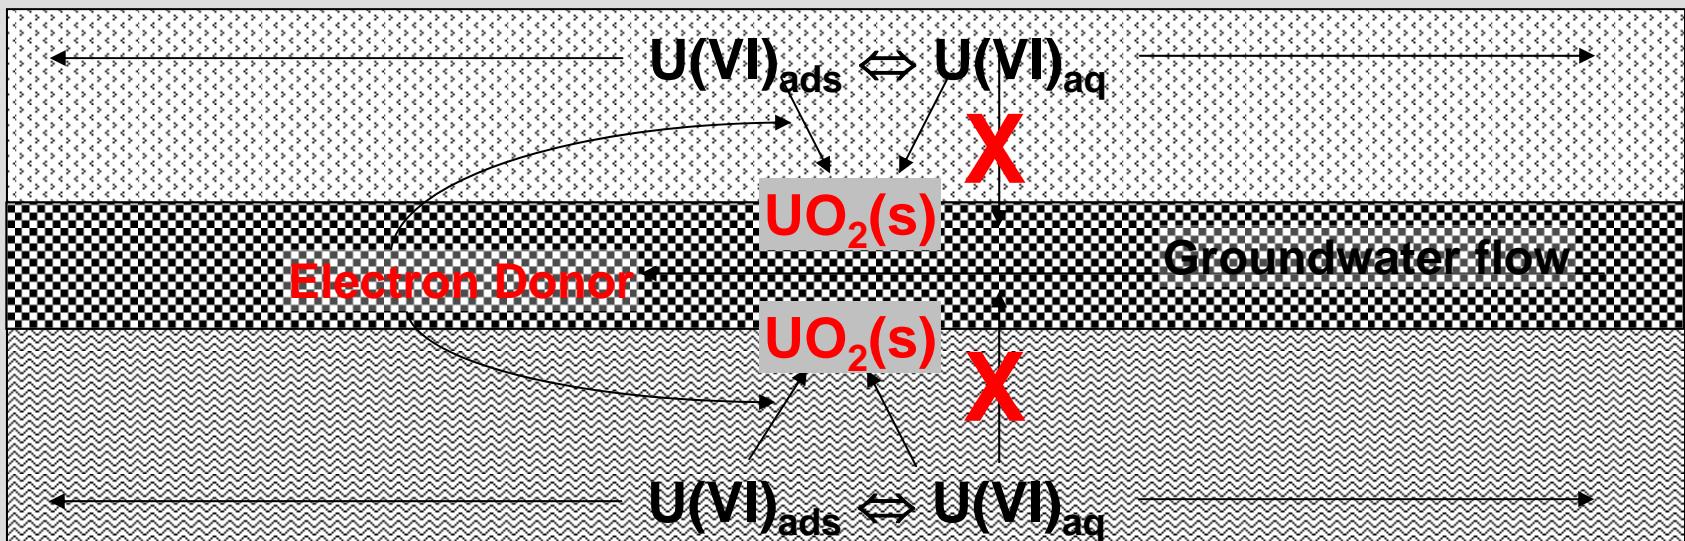

Introduction

- ▶ Three geologic materials
- ▶ Gravel layer at the bottom of the historically excavated zone is dominant groundwater flow path
- ▶ High solid-associated uranium concentration at the gravel zone and saprolite zone

Introduction

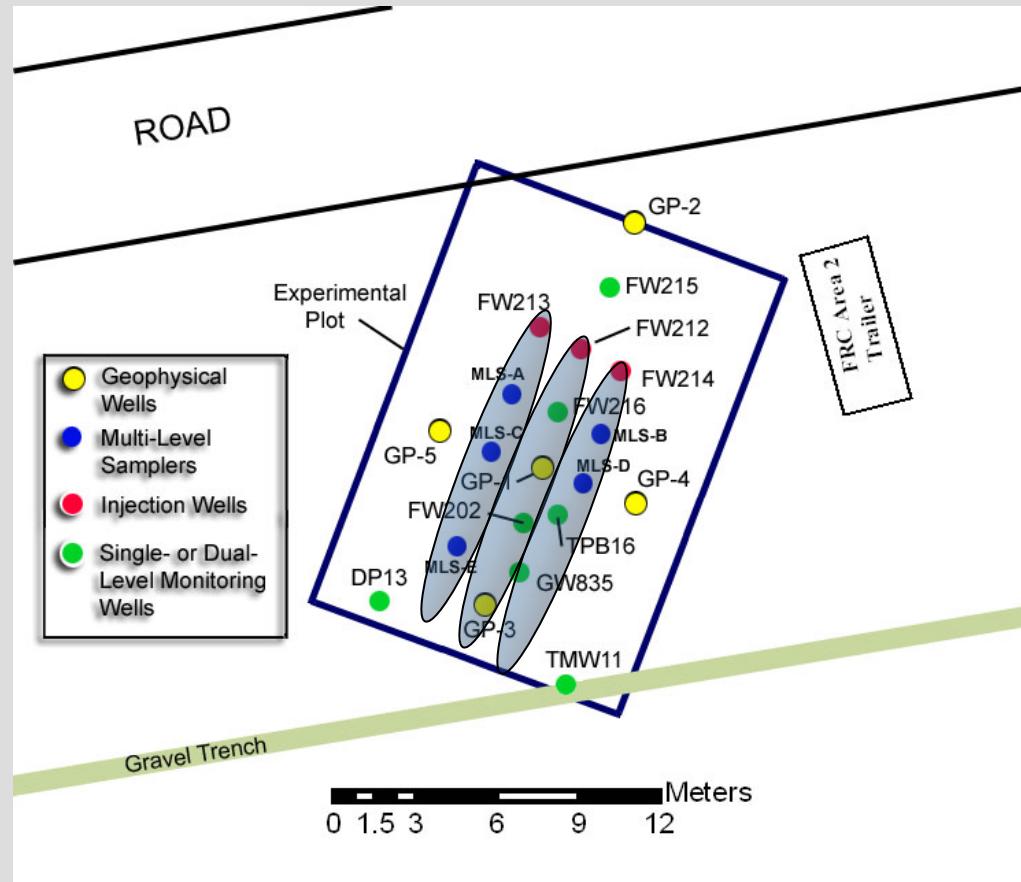

Hypothesis - The injection of electron donor into the gravel layer will result in:

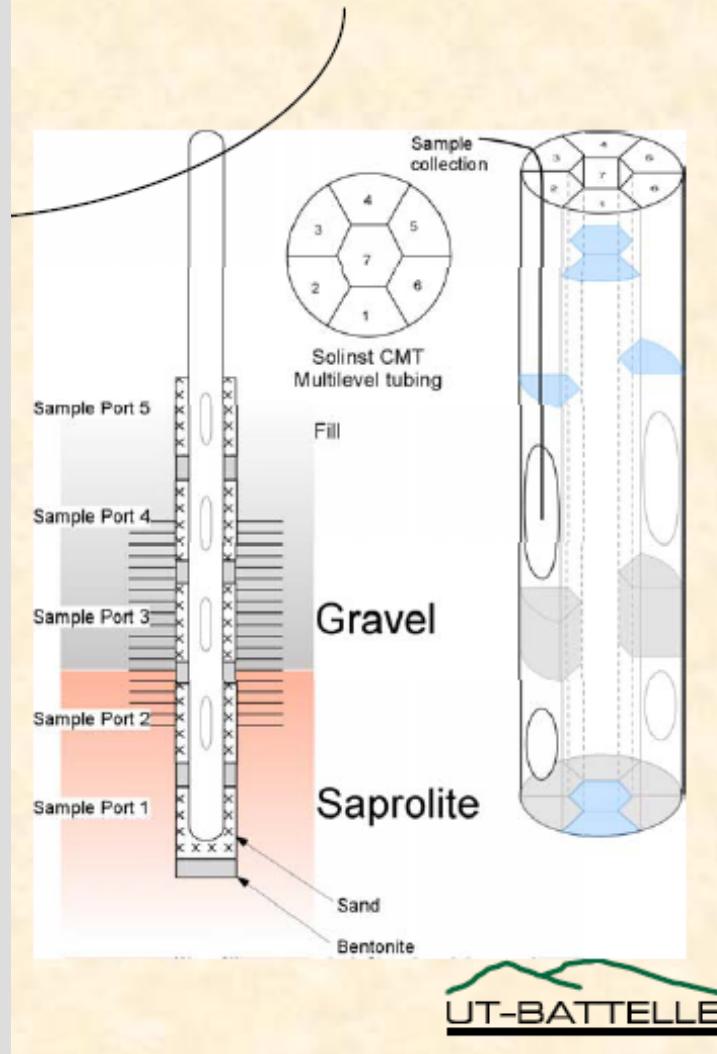

- ▶ Dispersive mass transfer into the adjacent fill/saprolite zones
- ▶ Formation of a microbarrier at the interface
- ▶ Immobilization of uranium

Biostimulation Experiment

- ▶ 10 mM ethanol, 5 mM bromide solution
- ▶ Three injection wells, 3 L/min each well
- ▶ 24-hour initial injection pulse followed by daily one-hour pulses
- ▶ Inflow of 0.5 mM NO_3^- , 0.885 mM SO_4^{2-} and 0.5 μM U from up-gradient
- ▶ Started late September 2005

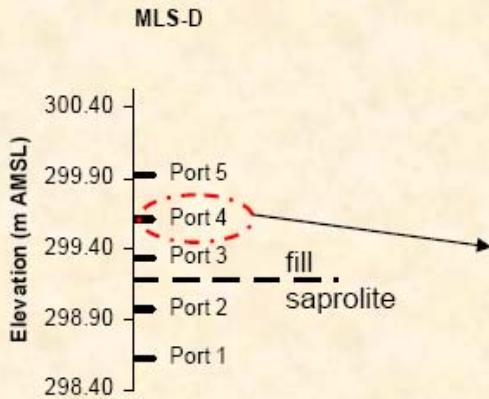

Multi-level Sampling (MLS) Wells – vertical resolution and across fill/ saprolite interface

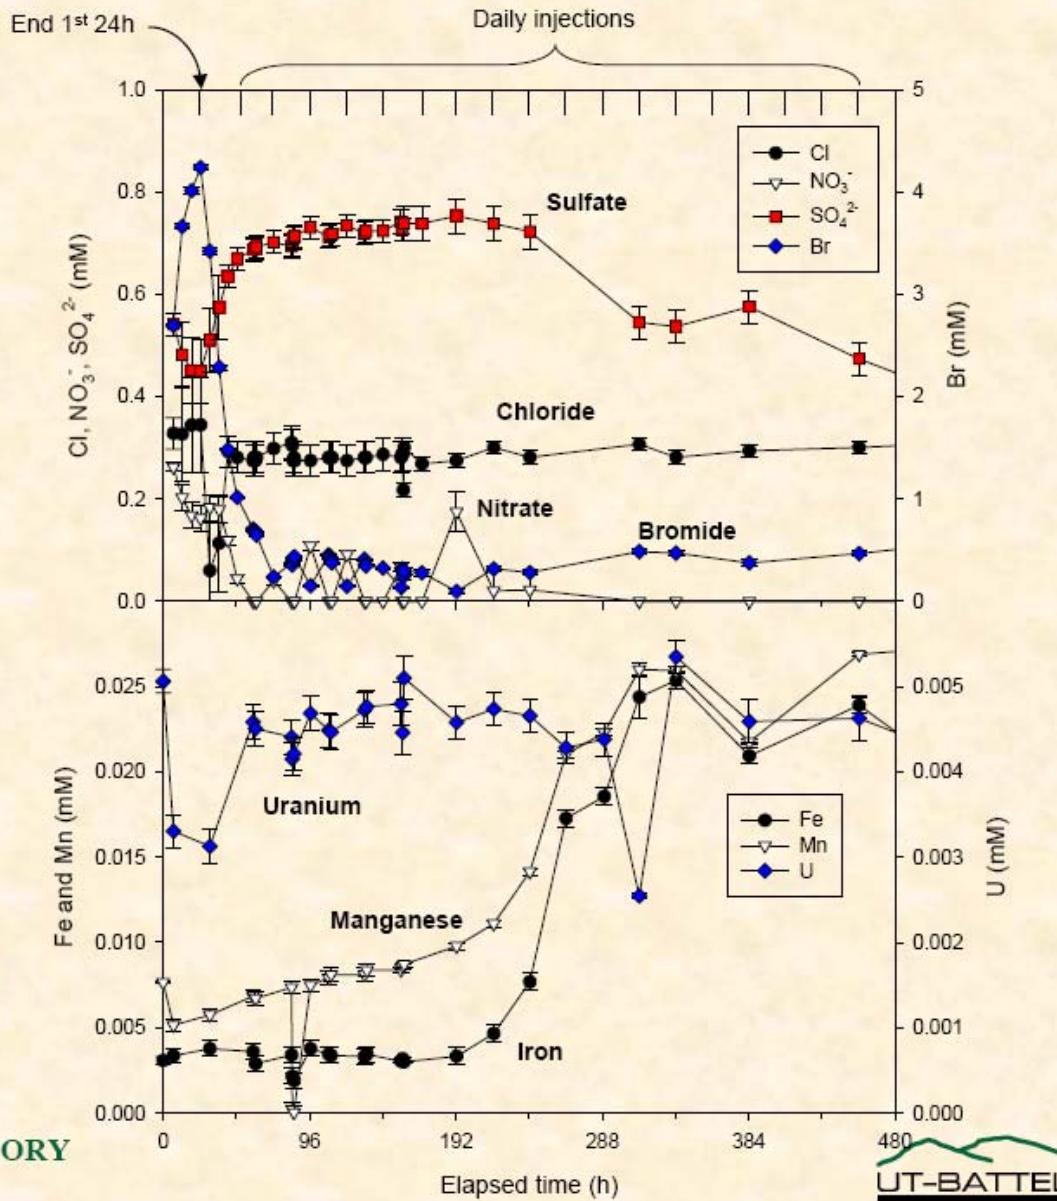

UT-BATTELLE

► Short-Term Response

MLSD-4

- In the first 20 days
 - NO_3^- reduction
 - Mn reduction
 - Fe reduction
 - SO_4^{2-} reduction
 - Sulfide generation
- Coupling of [Br] (surrogate for EtOH delivery) and $[\text{NO}_3^-]$ + $[\text{SO}_4^{2-}]$

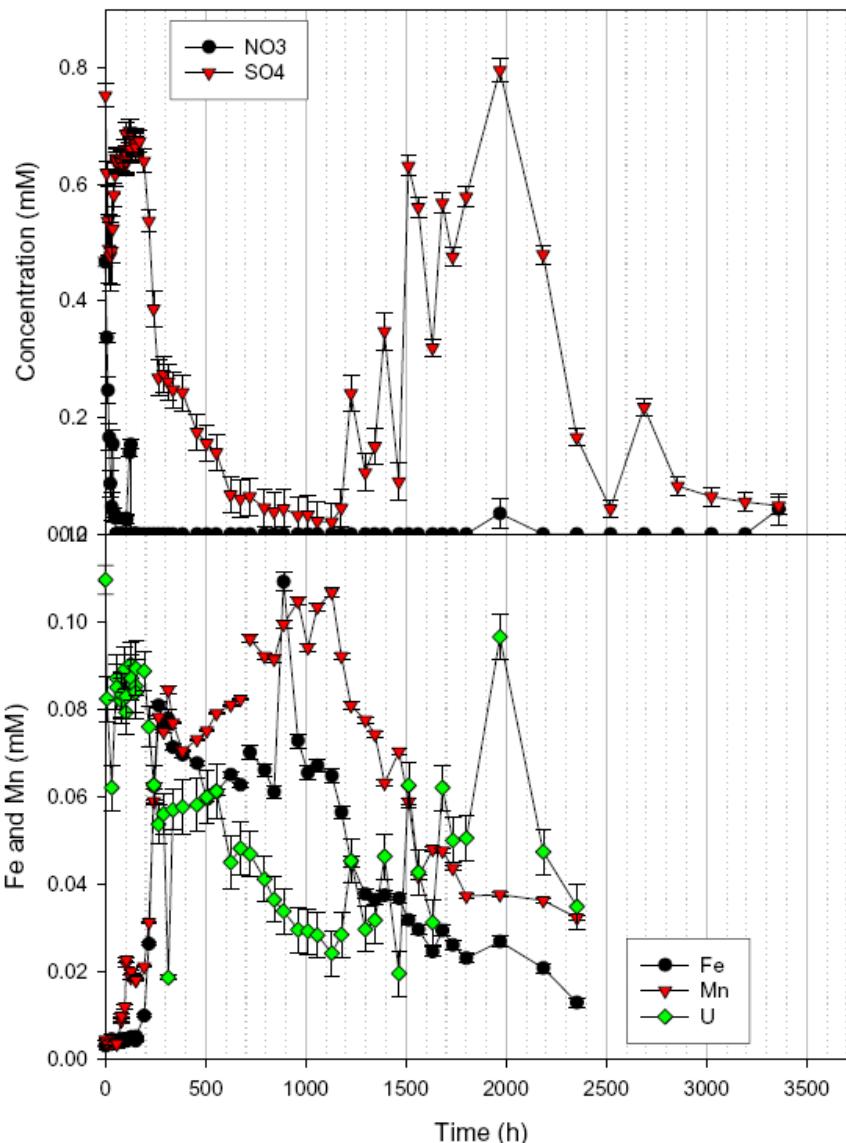

OAK RIDGE NATIONAL LABORATORY
U. S. DEPARTMENT OF ENERGY

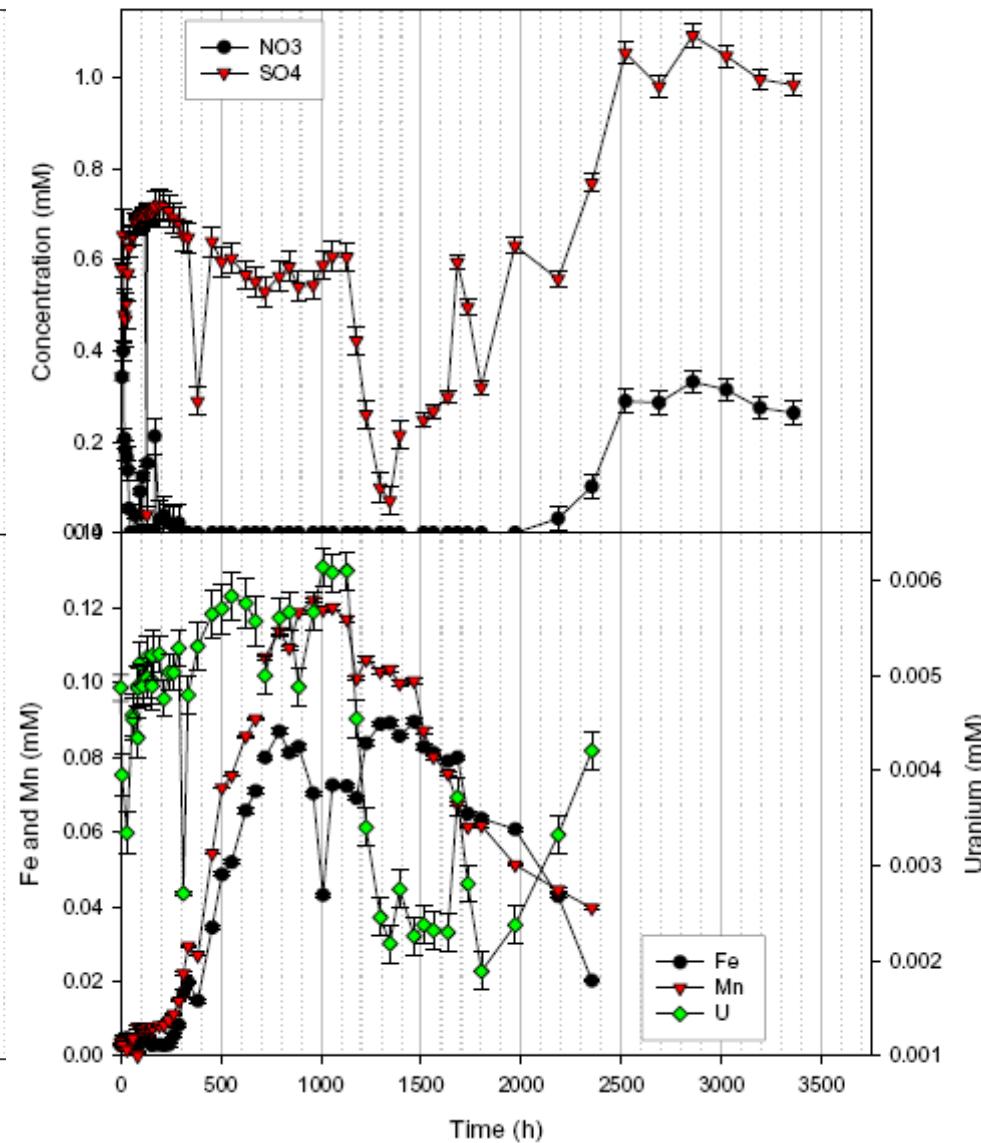

PACIFIC NORTHWEST NATIONAL LABORATORY
U.S. Department of Energy

► Mid-Term Response

MLSB-4

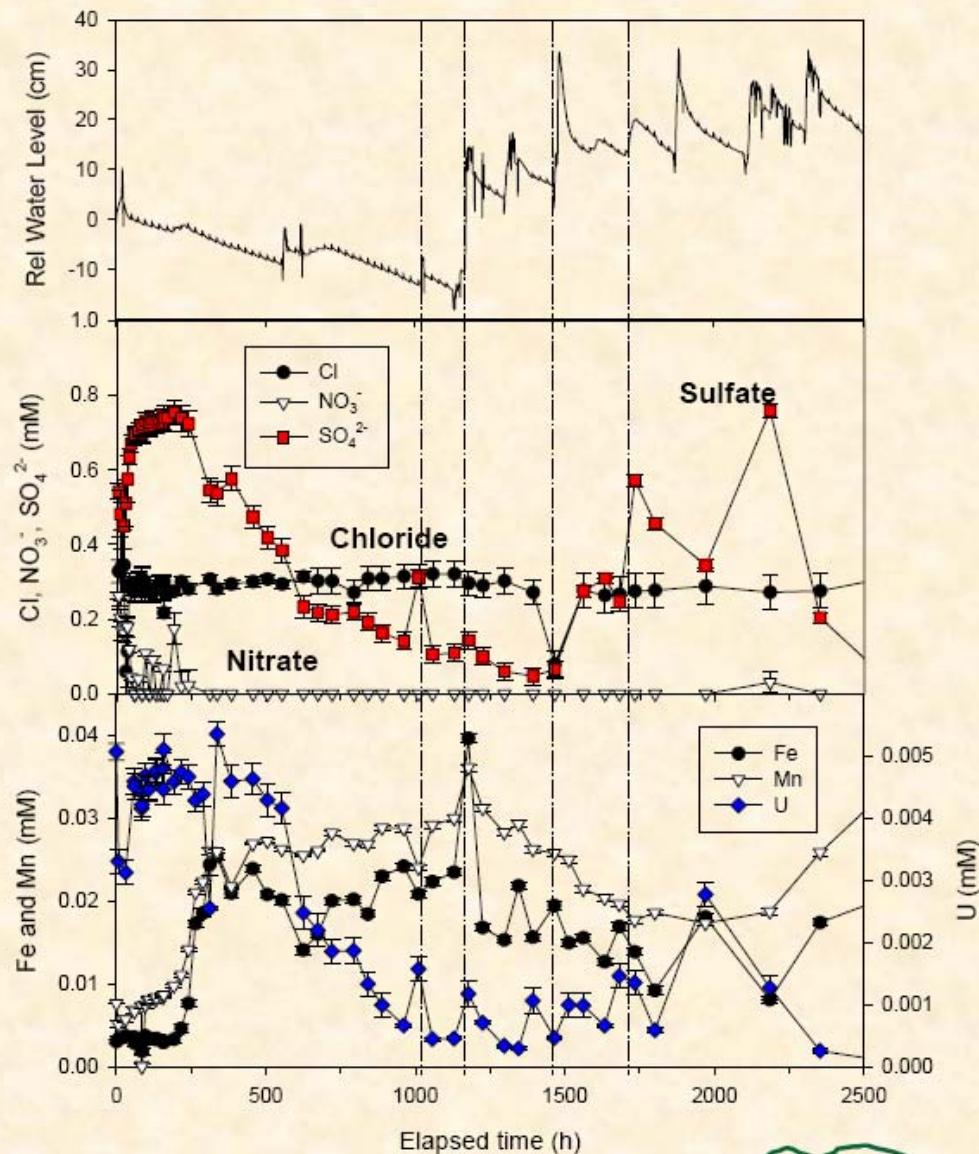

MLSC-4

Regional recharge events drive biogeochemical dynamics in shallow aquifer

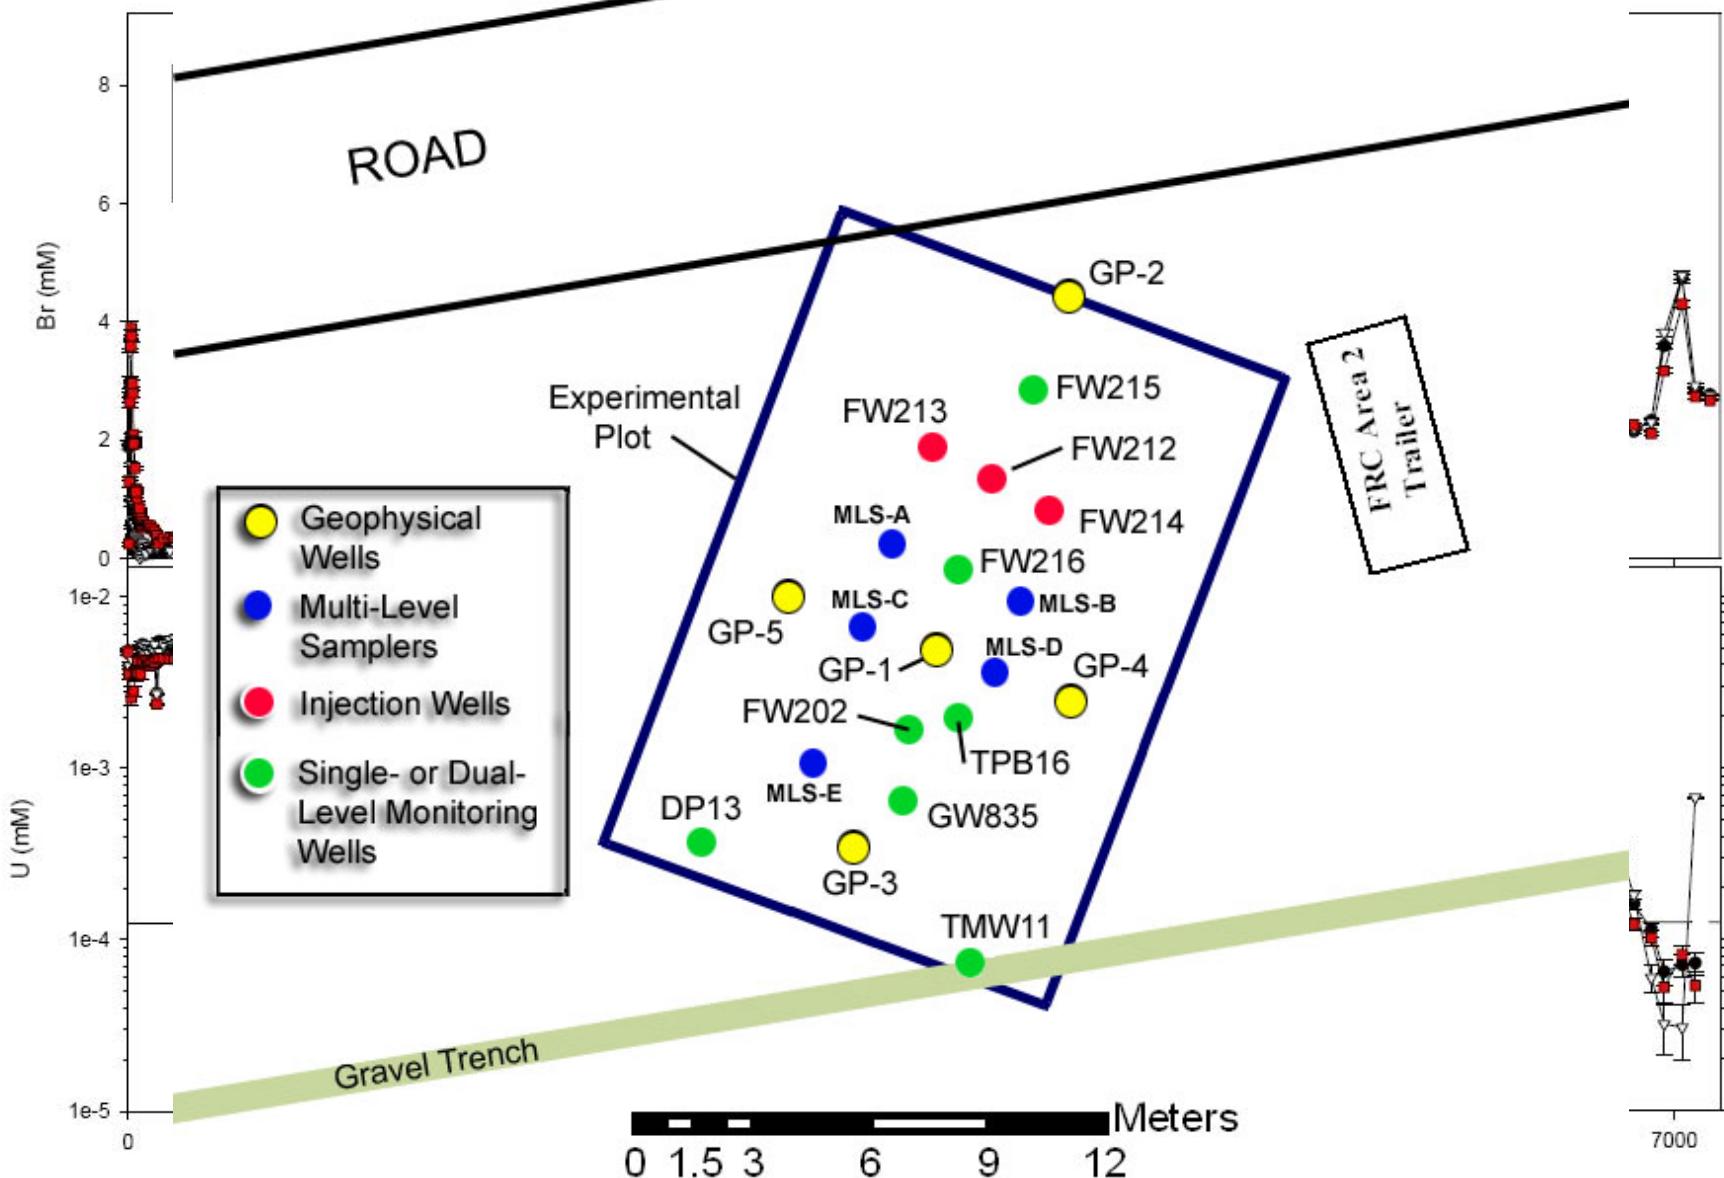

- Ethanol delivery promoted reducing conditions
 - $\text{NO}_3^- \rightarrow \text{Mn} \rightarrow \text{Fe} \rightarrow \text{SO}_4^{2-} \rightarrow \text{U(VI)}$
- Recharge water introduced dissolved O_2
 - Nitrate reduction continues but other terminal electron accepting processes are disrupted
- System restabilizes with continued EtOH delivery.

OAK RIDGE NATIONAL LABORATORY
U. S. DEPARTMENT OF ENERGY

► Long-Term Response

Sediment Sampling

Prebiostimulation
(Saprolite, 0-2 cm below gravel)

Postbiostimulation
(Saprolite, 0-2 cm below gravel)

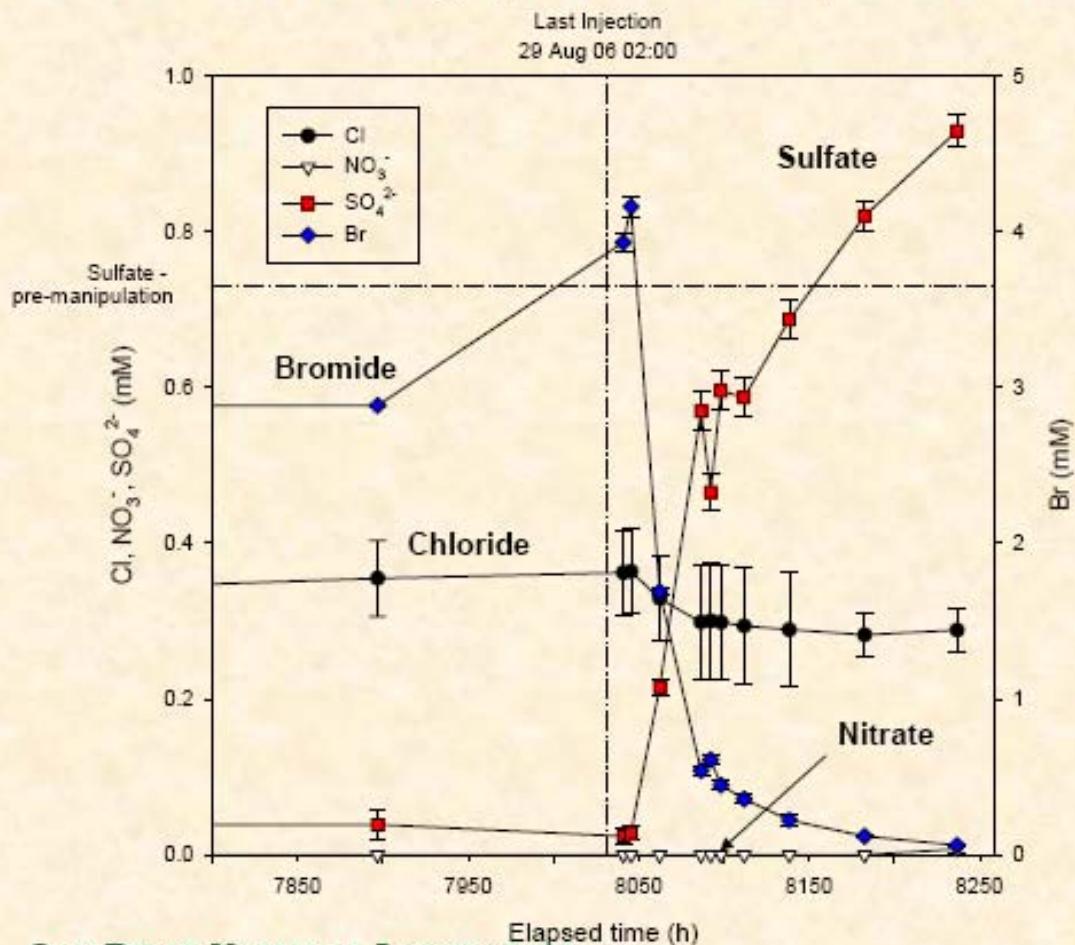

INSIDE BIOSTIMULATION ZONE

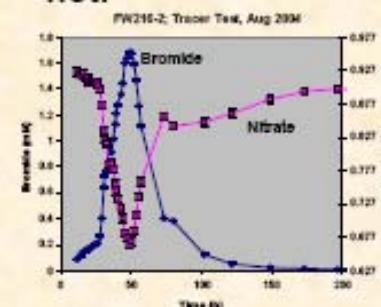

OUTSIDE BIOSTIMULATION ZONE

Monitoring post-manipulation dynamics

- Bromide is flushed out of system
- Nonreactive system: NO_3^- should increase to pre-manipulation levels (~0.9 mM) at the same rate Br decreases – it does not.
- Excess sulfate indicative of (ferrous) sulfide precipitate oxidation – redox barrier to U remobilization ?

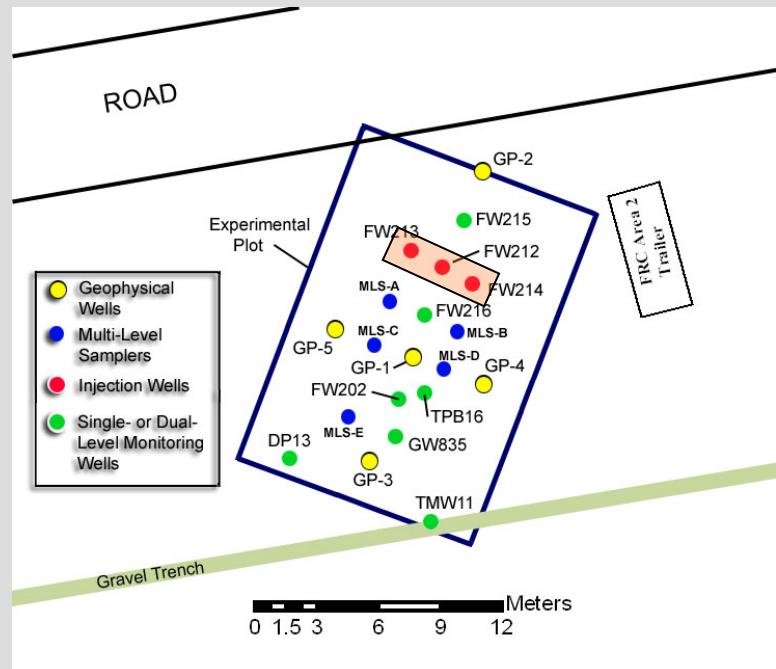

Conceptual Model

- ▶ Water table 4 meters below ground surface
- ▶ Model Domain:
 $L_x = 20 \text{ m}$, $L_y = 10 \text{ m}$, $L_z = 4 \text{ m}$
- ▶ Hydraulic Gradient 0.03, specified head in the x direction
- ▶ Well screen depth: 4.5m-6m

	Thickness (m)	Porosity	K (cm/s)
Disturbed Saprolite Fill	1.5	0.3	1.3e-2
Gravelly Fill	0.5	0.3	3.8e-2
Intact Saprolite	2	0.1	4.1e-5

Multicomponent Reactive Transport

- ▶ Conceptual model and hydrologic parameters from tracer test analysis
- ▶ 3 Injection Wells
FW213, FW212, FW214
- ▶ 92 Species
- ▶ 127 Reactions(50 fast, 77 slow)
- ▶ 29 Terminal Electron Accepting Processes (TEAPs)

TEAP Reactions

Reaction	Catalyzed By
$\text{CH}_3\text{CH}_2\text{OH} + 3\text{O}_2 \rightarrow 2\text{HCO}_3^- + \text{H}_2\text{O} + 2\text{H}^+$	AM, DM
$\text{CH}_3\text{CH}_2\text{OH} + 2.4\text{NO}_3^- + 0.4\text{H}^+ \rightarrow 2\text{HCO}_3^- + 1.2\text{N}_2 + 2.2\text{H}_2\text{O}$	DM
$\text{CH}_3\text{CH}_2\text{OH} + 0.5\text{NO}_3^- \rightarrow \text{CH}_3\text{COO}^- + 0.5\text{NH}_4^+ + 0.5\text{H}_2\text{O}$	DRM1, DRM2, DRM3
$\text{CH}_3\text{CH}_2\text{OH} + 2\text{MnO}_2 + 3\text{H}^+ \rightarrow \text{CH}_3\text{COO}^- + 2\text{Mn}^{2+} + 3\text{H}_2\text{O}$	DRM2, DRM3
$\text{CH}_3\text{CH}_2\text{OH} + 4\text{FeOOH} + 7\text{H}^+ \rightarrow \text{CH}_3\text{COO}^- + 4\text{Fe}^{2+} + 7\text{H}_2\text{O}$	DRM2, DRM3
$\text{CH}_3\text{CH}_2\text{OH} + 0.5\text{SO}_4^{2-} \rightarrow \text{CH}_3\text{COO}^- + 0.5\text{HS}^- + 0.5\text{H}^+ + \text{H}_2\text{O}$	DRM3, SO4RM
$\text{CH}_3\text{CH}_2\text{OH} + 2\text{S}^{0} + \text{H}_2\text{O} \rightarrow \text{CH}_3\text{COO}^- + 2\text{HS}^- + 3\text{H}^+$	DMR3, S0RM
$\text{CH}_3\text{CH}_2\text{OH} + 0.5\text{HCO}_3^- \rightarrow \text{CH}_3\text{COO}^- + 0.5\text{CH}_4 + 0.5\text{H}^+ + 0.5\text{H}_2\text{O}$	MGM
$\text{CH}_3\text{COO}^- + 2\text{O}_2 \rightarrow 2\text{HCO}_3^- + \text{H}^+$	AM, DM
$\text{CH}_3\text{COO}^- + 1.6\text{NO}_3^- + 0.6\text{H}^+ \rightarrow 2\text{HCO}_3^- + 0.8\text{N}_2 + 0.8\text{H}_2\text{O}$	DM
$\text{CH}_3\text{COO}^- + \text{NO}_3^- + \text{H}_2\text{O} + \text{H}^+ \rightarrow 2\text{HCO}_3^- + \text{NH}_4^+$	DRM2, DRM3
$\text{CH}_3\text{COO}^- + 4\text{MnO}_2 + 7\text{H}^+ \rightarrow 2\text{HCO}_3^- + 4\text{Mn}^{2+} + 4\text{H}_2\text{O}$	DRM2, DRM3
$\text{CH}_3\text{COO}^- + 8\text{FeOOH} + 15\text{H}^+ \rightarrow 2\text{HCO}_3^- + 8\text{Fe}^{2+} + 12\text{H}_2\text{O}$	DRM2, DRM3
$\text{CH}_3\text{COO}^- + \text{SO}_4^{2-} \rightarrow 2\text{HCO}_3^- + \text{HS}^-$	DRM3, SO4RM
$\text{CH}_3\text{COO}^- + 4\text{S}^{0} + 4\text{H}_2\text{O} \rightarrow 2\text{HCO}_3^- + 4\text{HS}^- + 5\text{H}^+$	DRM3, S0RM
$\text{CH}_3\text{COO}^- + \text{H}_2\text{O} \rightarrow \text{HCO}_3^- + \text{CH}_4$	MGM

Reactions in red: Complete oxidation Reactions in green: Incomplete oxidation

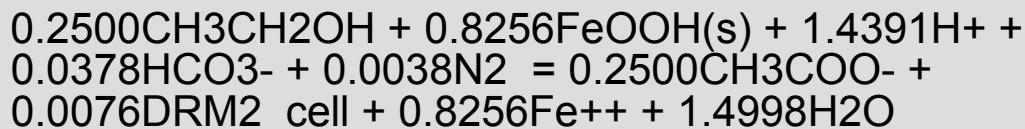

DRM – dissimilatory reducing microorganisms, AM – aerobic microorganisms

DM – denitrifying microorganisms, SO4RM – sulfate reducing microorganisms

S0RM – sulfur reducing microorganisms, MGM – methanogenic microorganisms

TEAP Reactions

- ▶ Overall balanced reaction for biological growth derived from bioenergetics-based approach in which the partitioning of electron flow between energy generation and biomass production is dependent on the free energy of the corresponding TEAP (Rittman and McCarty, 2001)

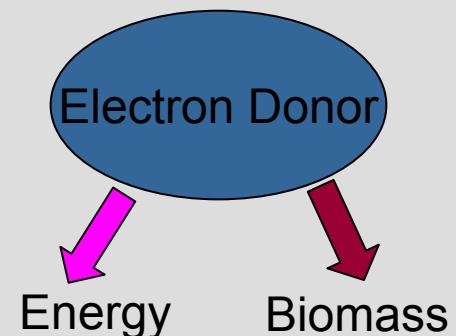

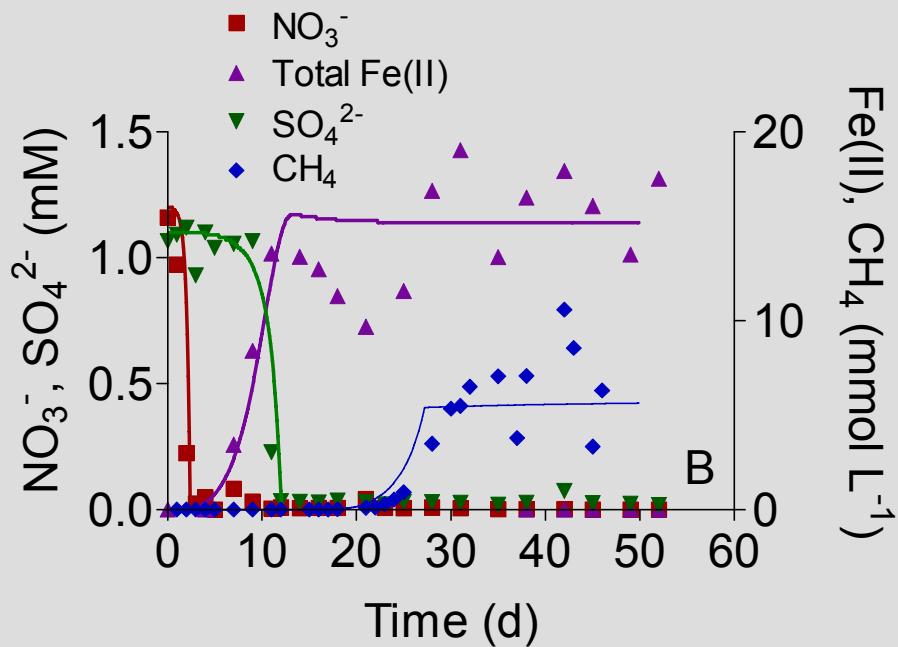

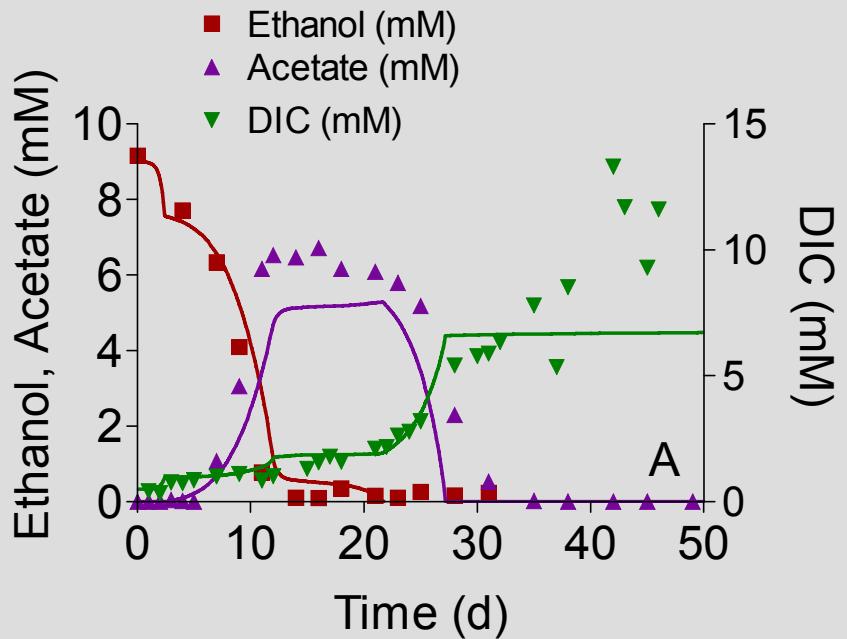

- ▶ Rate laws consider thermodynamic constraints

$$R_{Fe(III)} = V \max_{Surf} \frac{[Cells]}{Km_{Cells} + [Cells]} [Fe(III)SurfFree] f(\Delta G_{rxn})$$

$$f(\Delta G_{rxn}) = 1 - \exp((\Delta G_{rxn} - \Delta G_{min}) / RT)$$

ΔG_{min} = minimum free energy change required to drive cellular energy metabolism (-20 kJ/mol) (Schink, 1997)

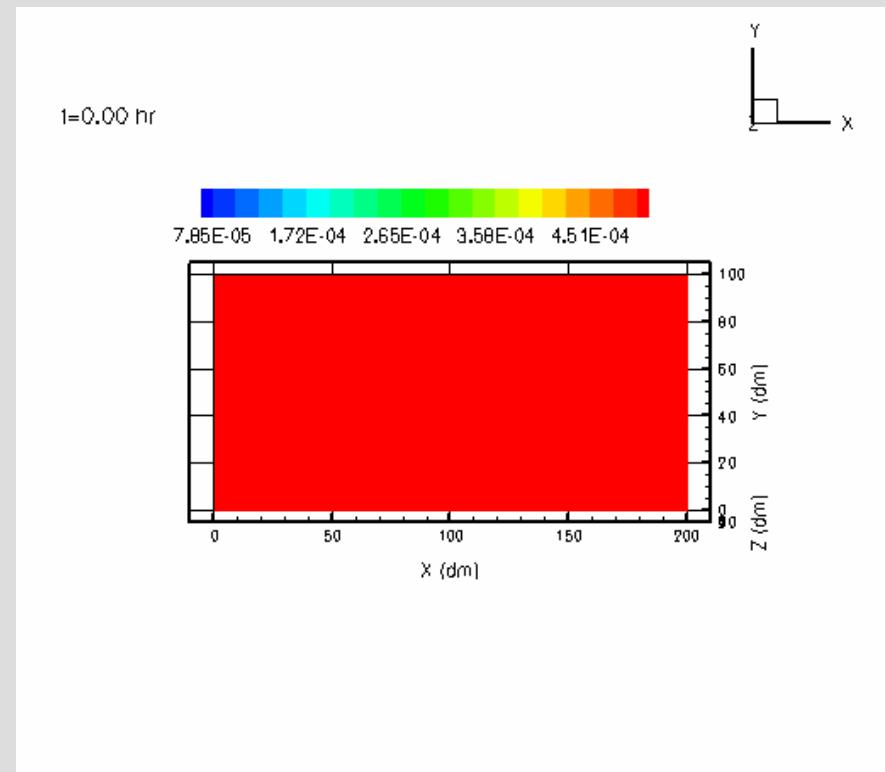

Only adjustable parameter values: 1. Fe(III) max. reduction rate V_{\max}
 2. Initial biomass values

Experimental Design

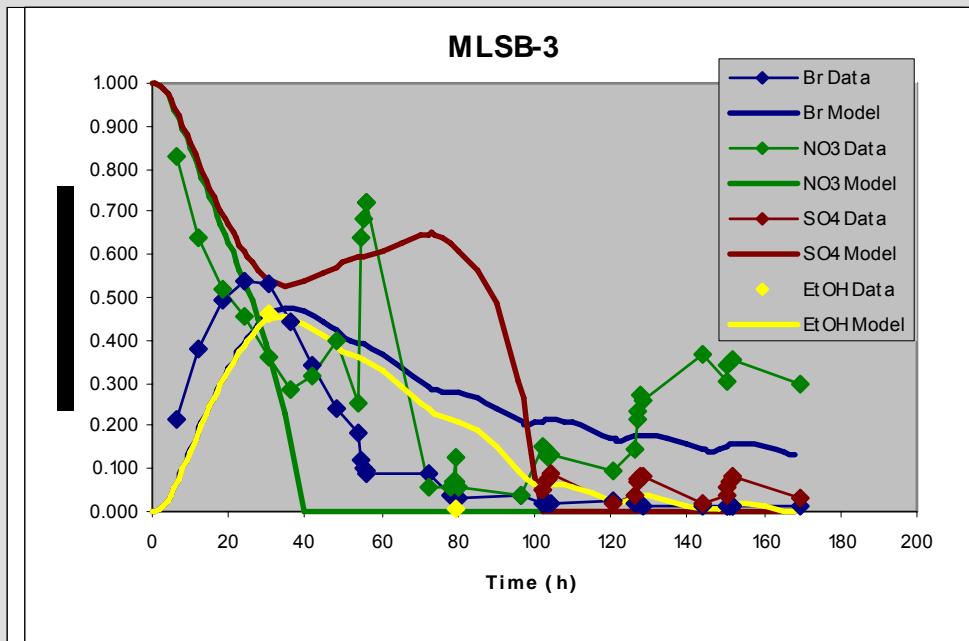

- ▶ Goal: Select injection strategy
 - Effectively remove nitrate from treatment zone
 - Create fairly uniform zone of ethanol delivery
 - Do not add too much electron donor
- ▶ Several alternatives simulated

Nitrate in gravel layer

MLSB – inorganic, organic, and microbial analyses complete the picture

- *Clostridia* (anaerobic soil bacteria) ferment EtOH + Acetate to butyrate, H₂, and other fatty acids
- Butyrate yield increases as Acetate:EtOH ratio increases
- Phylogenetic analysis 16S rDNA fragments from DGGE gels of field samples from the same wells indicate *Clostridia*

Long-Term Shift in Flow Pattern?
